

Sprint #3 Report  
Crowdsourced Anonymity  
Crowdsourced Anonymity  
July 23, 2019

Actions to stop doing: I think that we could have worked more on the project in person instead of asking for help on the group chat, that would have increased our productivity. Also we could have worked faster by not waiting for one person to finish and then starting to help them as that takes away a lot of time.

Actions to start doing: There is no sprint four due to the lack of time in the summer session but if we had more time we would love to have worked on working on getting the users history and turning that into a csv file however that also involves a lot of OS knowledge since it depends which OS you are using and on the browser.

Actions to keep doing: If we had more time we could have definitely made more progress on the application by working on fixing and adding some things in our code and functionalities that would make our product a lot better.

Work completed/Not completed: We completed the part that returns a randomized and anonymized list of urls for the user's random group. We also completed the part which gets a list of urls and opens and closes them. Overall we were basically able to complete all the functionality that we wanted to have completed.

Work completion rate:

The number of User stories we completed this sprint was 2. The total number of estimated ideal working hours completed during this sprint is 27. The average ideal work hours computed across all sprints to date is 21.333 and the average user stories is 2. The final burn up chart for this sprint is:
